**PEPTIDE PURIFICATION****FIELD OF THE INVENTION**

5

The present invention relates to the purification of peptides, in particular intermediate-size peptides, more particularly nona- and decapeptides, such as LHRH-antagonists.

10

**BACKGROUND OF THE INVENTION**

Most intermediate size natural and synthetic peptides are amorphous substances. Many of them have pharmacologically interesting properties, such as many nona- and decapeptides which are LHRH (luteinizing hormone-releasing hormone) antagonists. One particular substance of this kind known only in amorphous form is the synthetic decapeptide of the formula (I)

20

Ac-D-2Nal-D-4ClPhe-D-3Pal-Ser-MeTyr-D-Asn-Leu-Lys(iPr)-Pro-D-Ala-NH<sub>2</sub> (I)

which, being a potent LHRH antagonist, has desirable pharmacological properties.

25

For use in pharmaceutical preparations it is necessary for the LHRH antagonist (I) and nona- and decapeptides of similar structure to be essentially pure. The raw product obtained in the last step of a multiple-step synthesis is purified by chromatographic and other methods. To eliminate residual solvent from the chromatography a thus purified product usually has to be dissolved in an aqueous medium and freeze-

30

dried. This is a costly process producing a voluminous product which is not easy to handle.

5 A process of purification of an otherwise pure peptide from residual organic solvent by other means than freeze-drying thus is desirable.

#### OBJECTS OF THE INVENTION

10

It is an object of the present invention to provide a process of purification of an otherwise pure peptide of the aforementioned kind from residual organic solvent which avoids freeze-drying.

15

It is another object of the present invention to provide such an otherwise pure peptide which is essentially free from residual organic solvent and is not in the form of a cryoprecipitate.

20

Further objects of the invention will become obvious from the following summary of the invention, the description of a preferred embodiment thereof, and the appended claims.

25

#### SUMMARY OF THE INVENTION

30 According to the present invention is provided a process of purification of an otherwise pure peptide, in particular a nona- or decapeptide, most particularly a nona- or decapeptide which is an LHRH antagonist, from residual organic solvent, comprising the following steps:

8 689 95 10

Ink. t. Patent- och Märket

2001-12-29

Huvudfaxen Kassa

3

- dissolving said otherwise pure peptide in a dissolution solvent mixture comprising water and at least one alcohol selected from methanol, ethanol, propanol, isopropanol;
  - adding the solution of the otherwise pure peptide in said solvent mixture to a vigorously stirred precipitation solvent mixture essentially consisting of one or several polar compounds selected from methyl acetate, ethyl acetate, methyl propionate, ethyl propionate, ethyl isopropionate, butyl acetate, isobutyl acetate, t-butyl acetate, ethyl formate, propyl formate, isopropyl formate, and one or several non-polar compounds selected from hexane, heptane, octane, cyclohexane, methylcyclohexane, and, optionally, of up to 5% of acetic or propionic acid;
  - isolating the precipitated peptide;
  - washing the isolated peptide with one or a mixture of said polar compounds or a solvent or solvent mixture of similar polarity,
  - drying the washed peptide,
- with the proviso that the water content of said solvent mixture comprising water and at least one alcohol is below 8% (v/v), and that the volume ratio of the dissolution solvent mixture and the precipitation solvent mixture is 1:10 or more.

"An otherwise pure peptide" is a peptide which is sufficiently pure for use in a medicine except for volatile impurities which need to be removed or the content of which needs to be substantially reduced. The otherwise pure peptide will normally be a substance having undergone purification by chromatography.

Preferably the otherwise pure peptide is

Ac-D-2Nal-D-4ClPhe-D-3Pal-Ser-MeTyr-D-Asn-Leu-Lys (iPr)-Pro-D-Ala-NH<sub>2</sub> (I).

According to a first preferred aspect of the invention the water content of the dissolution solvent mixture is below 5% (v/v).

- 5 According to a second preferred aspect of the invention the volume ratio of the dissolution solvent mixture and the precipitation solvent mixture is at least 15, in particular at least 20.

- 10 According to a third preferred aspect of the invention the alcohol of the dissolution solvent mixture is ethanol.

- According to a fourth preferred aspect of the invention the polar component of the precipitation solvent mixture is ethyl  
15 acetate.

- According to a fifth preferred aspect of the invention the non-polar component of the precipitation solvent mixture is heptane.  
20

In the following the invention will be described in greater detail by reference to a preferred embodiment thereof which should not be understood to limit the invention.

25

#### DESCRIPTION OF A PREFERRED EMBODIMENT

- Example 1. The fractions containing pure compound (1) (100 g in total) in ethanol-water-acetic acid 40:59:1 (v/v/v)  
30 obtained from preparative HPLC by which the synthetically obtained product had been purified were pooled and concentrated in vacuo to an oil which was co-evaporated twice from ethanol. The resulting solid was dissolved in 440 ml of ethanol and the resulting clear solution added over a period

2001-12-29

Huvudfaxen Kassen

5

of 20 min to 8.8 L of ethyl acetate/heptane 1:1 (v/v).  
Stirring was continued for 1 hour and filtered. The amorphous  
product was washed with 3 L of ethyl acetate; it was found  
that this removed nearly all heptane. The washed product was  
5 dried in a vacuum oven at 40°C at 0.3 bar for 48 hrs.  
Elemental analysis of the dried product indicated that the  
monoacetate of (I) had been obtained. Cryoprecipitation, in  
contrast, produces the corresponding diacetate. In the  
following Table analytical parameters of the monoacetate of  
10 (I) produced according to the invention are compared with  
those of a corresponding lyophilized product (diacetate).

Table. All percentages are by weight

15                                      lyophilized product      precipitated product

|    |                          |         |         |
|----|--------------------------|---------|---------|
|    | Water                    | 3.4 %   | 3.0%    |
|    | Ethanol                  | <0.024% | <0.024% |
|    | Ethyl acetate            | <0.024% | <0.024% |
| 20 | Heptane                  | <0.024% | <0.024% |
|    | Acetic acid (as acetate) | 7.5%    | 3.9%    |
|    | HPLC purity              | 99.8%   | 99.8%   |
|    | Peptide content          | 88.8%   | 94.9%   |
|    | Loss in filtrate         | -       | 0.3%    |

25

Example 2. Variation of the composition of the precipitation  
solvent or solvent mixture; otherwise, procedure as in Example  
1. Precipitation in pure ethyl acetate results in from about  
3% to about 5% by weight loss of peptide. Precipitation in  
30 pure heptane results in a sticky product which is difficult to  
filter. A 1:1 (v/v) mixture of ethyl-acetate hexane gives a  
product which is easy to filter and dry; in repeated  
experiments the loss of peptide was always less than 0.5% by  
weight.

2001-12-29

Huvudfaxen Kassar

6

Example 3. Variation of water content of the solution of oily product in the dissolution solvent (absolute ethanol); otherwise, procedure as in Example 1. A water content of 10% (v/v) results in a sticky product on precipitation which is difficult to filter. A water content of 15% (v/v) results in an oily product on precipitation. To obtain satisfactory results the water content must not exceed 8% (v/v) but should preferably be kept below 5% (v/v). A water content below 5% is accomplished by co-evaporating the oily product from the chromatography at least twice with ethanol.

Example 4. Variation in precipitation temperature; otherwise, procedure as in Example 1. The precipitation temperature proved to be not critical. It could be varied from 0°C to 20°C without noticeable differences in product yield and morphology.

Example 5. Variation of concentration of (I) in the dissolution solvent; otherwise, procedure as in Example 1. It was found that the concentration of the oily product from the chromatography which had been co-evaporated with ethanol in the dissolution solvent should be as high as possible. Even a concentration of 330 g by weight could be used.

Example 6. Variation of ratio between dissolution solvent and precipitation solvent volumes and other variations; otherwise, procedure as in Example 1. The optimum ratio was found to be about 1:20. It could be shown that ratios from 1:15 to 1:30 gave satisfactory results. A ratio of 1:10 resulted in a sticky product. Precipitation is very fast. The suspension can be filtered 30 min after the last addition of dissolved substance. Washing with ethyl acetate did not result in loss of product but efficiently removed heptane.

## CLAIMS

1. A process of purification of an otherwise pure nona- or  
5 decapeptide from residual organic solvent, comprising the  
following steps:
- dissolving the nona- or decapeptide in a dissolution solvent  
mixture comprising water and at least one alcohol selected  
from methanol, ethanol, propanol, isopropanol;
  - 10 - adding the solution of the nona- or decapeptide in said  
solvent mixture to a vigorously stirred precipitation solvent  
mixture essentially consisting of one or several polar  
compounds selected from methyl acetate, ethyl acetate, methyl  
propionate, ethyl propionate, ethyl isopropionate, butyl  
15 acetate, isobutyl acetate, t-butyl acetate, ethyl formate,  
propyl formate, isopropyl formate, and one or several non-  
polar compounds selected from hexane, heptane, octane,  
cyclohexane, methylcyclohexane, and, optionally, of up to 5%  
of acetic or propionic acid;
  - 20 - isolating the precipitated nona- or decapeptide;  
- washing the isolated nona- or decapeptide with one or a  
mixture of said polar compounds or a solvent or solvent  
mixture of similar polarity,  
- drying the washed nona- or decapeptide,
  - 25 with the proviso that the water content of said solvent  
mixture comprising water and at least one alcohol is below 8%  
(v/v), and that the volume ratio of the dissolution solvent  
mixture and the precipitation solvent mixture is 1:10 or more.
- 30 2. The process of claim 1, wherein the water content of said  
solvent mixture comprising water and at least one alcohol is  
below 5% (v/v).

Ink. t. Patent- och reg.verket

2001-12-29

8

Huvudfaxen Kassen

3. The process of claim 1, wherein said nona- or decapeptide is an LHRH antagonist.

4. The process of claim 3, wherein said nona- or decapeptide is Ac-D-2Nal-D-4ClPhe-D-3Pal-Ser-MeTyr-D-Asn-Leu-Lys(iPr)-Pro-D-Ala-NH<sub>2</sub> (I).

5. The process of claim 4, wherein Ac-D-2Nal-D-4ClPhe-D-3Pal-Ser-MeTyr-D-Asn-Leu-Lys(iPr)-Pro-D-Ala-NH<sub>2</sub> (I) is obtained in form of the monoacetate.

6. The process of claim 1, wherein the water content of the dissolution solvent mixture is below 5% (v/v).

7. The process of claim 1, wherein the volume ratio of the dissolution solvent mixture and the precipitation solvent mixture is at least 15.

8. The process of claim 1, wherein the alcohol of the dissolution solvent mixture is ethanol.

9. The process of claim 1, wherein the polar component of the precipitation solvent mixture is ethyl acetate.

10. The process of claim 1, wherein the non-polar component of the precipitation solvent mixture is heptane.

11. The monoacetate of Ac-D-2Nal-D-4ClPhe-D-3Pal-Ser-MeTyr-D-Asn-Leu-Lys(iPr)-Pro-D-Ala-NH<sub>2</sub>.

Huvudfaxen Kassan

## ABSTRACT

A nona- or decapeptide is purified from residual organic solvent by dissolving in a solvent comprising water and at least one C<sub>1</sub>-C<sub>3</sub> alcohol followed by precipitation into a vigorously stirred solvent consisting of an alkyl ester of a carboxylic acid, the ester comprising from 3 to 6 carbon atoms, and one or several non-polar compounds selected from hexane, heptane, octane, cyclohexane, methylcyclohexane, and, optionally, of up to 5% of acetic or propionic acid, isolating the precipitated nona- or decapeptide, followed by washing with one or a mixture of C<sub>3</sub>-C<sub>5</sub> esters and drying, with the proviso that the water content of the solvent comprising water and the at least one alcohol is below 8% (v/v), and that the volume ratio of the dissolution solvent mixture and the precipitation solvent mixture is 1:10 or higher. Also described is the monoacetate of Ac-D-2Nal-D-4ClPhe-D-3Pal-Ser-MeTyr-D-Asn-Leu-Lys(iPr)-Pro-D-Ala-NH<sub>2</sub>.
